Novice Genomics Researchers (NGR) Needs Assessment Interview

Introduction: Thank you very much for meeting with me today.

The purpose of our discussion is to understand how novice genomics researchers interact with analysis software and to talk a bit about your experiences working with genomics data

I hope this discussion will reveal diverse opinions and insight on possible ways to improve, and make more user-friendly, genetic analysis software.

Please remember as a volunteer, you can refuse to answer any questions and stop the interview at any time.

You cannot expect any benefit from this interview, but hopefully some changes in software from yours and others suggestions, may improve the usability.

Do I have your consent to ask you my interview questions?

Do I have your consent to audio record your responses? You can request the tape is stopped at any Time.

I am starting the audio recording now. My first question is:

1. Background/Experience of utilizing (genomics software)

- **Could you please briefly introduce yourself** and provide a bit of background on your experience working with genomic data?

- **What do you remember** about your first experiences working with genomics data? How did you get started? What educational resources did you use, if any?

- **What kinds of genomic analysis software** have you utilized to conduct your research? Could you name a few examples of the tools you have used in the past? What are you using the (genomics software) for (how did/does your workflow look like)?

- **EMOTIONAL: How did you feel** when you were working with (genomics software)? Did your feelings change as you worked more with that analysis tool?

- **COGNITIVE: What concerns or questions** did you have about utilizing (genomics software) when you first started using it? What, if any information was missing? Do you think this played a big role in the analysis timeline/performance?

- **OVERALL EXPERIENCE:** Overall, how would you describe your experience working with (genomics software)?

2. Perceived positives and negatives of (genomics software)

- **POS/NEG**: Thinking back, what do you see as **positives or negatives** about utilizing (genomics software)?

- **PIPELINE IMPACT**: How has utilizing (genomics software) **influenced your analysis pipeline**, if at all?

- **UPKEEP/COST IMPACT**: Has utilizing (genomics software) **influenced your cost/upkeep of your experiments**, if at all? (i.e. having to store intermediate files? Using more computational resources?)

- **OVERALL IMPACT**: Has utilizing (genomics software) **influenced any other aspect of your experience** being a genomics researcher?

3. Preferences for (genomics software)

- **DO IT AGAIN**: If you could do your analysis process all over again, would you utilize (genomics software) again or utilize something else?

- **WHAT WENT WELL**: What went well about the process? (how notified, educational needs, provider support)

- **WHAT TO CHANGE**: Do you have any recommendations for changes or additions to (genomics software) that would aid in your research? Could you perhaps rank these changes/additions? Have you considered ___, ___, or ___?

4. Exploratory questions:

- As the NHGRI and other genomics research organizations are moving toward cloud computing, what challenges/concerns do you anticipate facing when conducting genomic research in the cloud?
    - Privacy
    - Cost

5. Demographics

Age	
Sex (self-described)	
Race (self-described)	
Ethnicity (self-described)	
Education level	
Work Title	
Familiarity with genetics (self-described)
